

SIHL ONE - change proposal

Changes arising from the closed user group, including six refinements from the Chief Business Development Officer. Each item sets out what changes, what has been decided, and what still needs a decision. Nothing here has been built.

Baseline commit 18aff39 | Revision 2 - incorporates CBDO review | No change proceeds without CPAIO approval

Five principles behind these changes

These are not ten unrelated requests. Nearly all of them resolve to one of five rules, and the rules matter more than any single item - they are what will keep the next ten consistent.

1 · The declarer must not be the beneficiary	A quality flag ticked by the person it rewards is not a control. The salesperson makes a claim; the system earns the status from evidence; only evidence feeds incentive or score.
2 · Record quality, never block the work	Location, verification and translation all fail for honest reasons. A control that stops a rep recording a real visit produces worse data, not better.
3 · Labels are cosmetic; behaviour keys off structure	Admins can rename anything without breaking a dashboard, and nobody can rename their way into a permission.
4 · Claims and records are different things	Expenses are claims, not payables. Declared business is a claim, not revenue. The back office remains the record (ADR-0002).
5 · Deactivate, never delete	Retired statuses and products stay valid on historical records and visible in filters. A regulator's question must remain answerable.

The changes

1 Lead verification - the fake mobile number problem

A verification state on every lead, defaulting to **unverified**, recording *how* it was verified rather than merely whether. Verified by connected call, by the client entering it themselves at an event or referral link, by OTP at a moment the client initiated, or by a silent number lookup. A rep's own assertion is recorded but never sufficient alone.

Allocation rule: you own what you enter until it is verified. Unverified leads stay with their creator - not pooled, not reassigned, not scored.

Why not OTP at entry, as management asked. OTP proves *someone* received a code, not that the *right* someone did. A rep willing to type a fake number will use a SIM they control and pass every time - producing fake numbers carrying a verified badge, which is worse, because the badge stops anyone looking twice.

Scoring caution. Count "number was never real" against data quality. Do *not* penalise "lead did not convert" - make honest closure costless, or the pipeline fills with leads nobody will close.

2 PAN at lead stage

Replace the PAN field with a disclosure control - **+ Add PAN (optional)** - revealing the field with the guidance *"Only if the client offers it. PAN is collected properly at account opening."*

Management's concern was reps asking for PAN because the field exists. Removing it from first sight addresses that; a "not mandatory" label would not have, because it restates the asterisk and still does not say "don't ask". Also consistent with data minimisation under DPDP, and with KYC belonging to the back office.

3 Product filter and display on the pipeline

- Multi-select product filter, **OR semantics**, All by default.
- Products shown as **chips** - two visible plus a count. Full detail on the record, not in the row; a lead can carry six products and detail-per-row destroys the table.
- Built as **one shared filter component** - three screens need it, and separate versions will drift apart.
- Filter list must include active products *plus any code present in data*, or leads tagged with a retired product become unfindable.

Database indexes required. Invisible at pilot volume, slow at thirty thousand leads. Cheap now, disruptive later.

4 Accompaniment, visit evidence and expenses

Accompaniment. Record when a senior or product expert attends alongside the owner - planned attendees on the task, actual attendees on the visit. They are different facts, and the gap tells you whether you have enough experts.

- **Credit stays with the primary owner**; support counted separately. Divisible credit gets negotiated over.
- Needing an expert is a **coaching signal, not a penalty** - if it lowers a rating, reps stop asking for help.

Visit evidence. One photo per visit, **taken inside the application** from the live camera - no option to attach a stored file - with the location and timestamp printed onto the image, in the familiar GPS camera style. Guidance on screen to include the ID card but not the client. Location required but **never blocking** - a failed reading marks the visit location-unverified rather than preventing the rep recording a real visit.

This is stronger than the first draft stated. That draft said a photograph could only ever be a deterrent, because a salesperson could attach an older picture from the gallery. Capturing from the live camera, with no attach option at all, closes that route: the image comes from the camera itself. On a mobile handset this is genuine evidence of presence. The CBDO's recommendation materially improves the control.

The printed address requires a mapping service, charged per photograph - a small running cost to confirm. The location and time are also stored as data alongside the image; if the two ever disagree, the stored record is the one that counts.

Expenses captured as a claim - amount, category, receipt, note, and an export for finance. **Approval, reimbursement status and payment tracking are explicitly out of scope**; the moment the CRM shows "approved" or "paid" it becomes a second system of record for money.

5 Product interest and filter on Customers

No new data needed - customers already carry product interest, copied across on conversion. This is a display change.

- A customer has **two** product relationships: what they are *interested in*, and what they *hold* (mirrored read-only from the back office). Showing only interest means a rep pitches something the client already owns.
- **Recommended: an Opportunities column** - interested but not held. That is the actionable list, and it makes “everyone who wants PMS and does not have it” a single click.
- Product interest should be **editable from the customer record**, or it decays into history nobody trusts.

6 User creation, employee codes, and one defect

Defect, not a feature request. The system already flags new users as needing a password change, and the web application ignores the flag entirely. **Temporary passwords therefore work indefinitely.** This should be fixed first, and enforced on the server - a screen-only prompt still leaves the temporary password working.

- Email suggested as **first.last@sihl.in**, editable, with collision handling.
- Employee codes: **SIHL-** for staff. Partners use **their existing back-office partner code** - the partner signs in as R0018, and users they create become R0018-01, R0018-02.
- Login accepts email, mobile or employee code.

Using the back-office code is an improvement on the first draft, which proposed inventing a separate four-letter code. Reusing the existing one means partner business ties back to the back office with nothing to map in between - which matters directly for verifying business booked.

Four points to confirm with the back office: whether the code format is always one letter and four digits; whether two digits per partner (99 users) is enough; that the login screen must accept both R0018 and R0018-01; and what should happen if a partner's code is ever changed at the back office, since every login built on it would break.

These two together create a new risk. Predictable emails plus sequential codes make every account guessable - and with five failed attempts locking an account, one laptop could lock out the whole sales floor repeatedly. Neither change causes this alone. Rate limiting must ship in the same release.

The prefix must never decide access. It is a label. Permissions come from the user's role, never from reading “SIHL” out of a code - otherwise a partner named similarly, or a typo, becomes a privilege escalation.

7 Brand mark

Replace the current drawn wordmark with the company logo.

Needed from marketing before this can be done well:

- A **vector (SVG)** version, or one three times larger. The supplied file is 220 pixels wide and will look visibly soft on modern screens - and softness in a logo reads as unprofessional.
- A **square, symbol-only mark** (the tree without text) for the browser tab and app icon. The full lockup shrunk to that size is unreadable.
- A **light version** for dark mode - mid-green on a near-black background is muddy.

Recommendation: the product keeps the name “SIHL ONE” in text - browser titles, reports, exports. The logo is the company; SIHL ONE is the product. A logo cannot appear in a page title.

Configurable statuses, sub-products and conversion capture

Task statuses become admin-managed. An administrator can add, rename and deactivate statuses, each with a one-line meaning shown when selected. Every status maps to a fixed system category, and all reporting keys off the category - so new statuses never break a dashboard.

Sub-products - two levels, so interactions record precisely which product was discussed. Capped at two deliberately; deeper hierarchies become unfilterable.

Conversion capture. At successful closure, record per product the business value and an identifier that lets the back office verify it - PAN or folio for mutual funds, client or UCC code for equity and derivatives. Example: mutual funds Rs. 1,00,000 and equity margin Rs. 50,000 recorded separately, not as one figure.

Declared values must not drive incentive. The rep's entry is a claim; it is matched against the back office, and **only matched values feed incentive and performance.** Otherwise the person who benefits from the number is the person typing it - the same problem as change 1. A persistent gap between declared and matched is itself a useful signal.

Meeting mode recorded per interaction - client site, office, online, call, chat - with photo and location required only for client-site meetings. Online meetings: the rep supplies a link, which is sent to the client by SMS, WhatsApp or email, with the option to capture a missing email address inline.

Two controls this must not skip. Links supplied by reps are sent to clients from SIHL's sender identity - they must be restricted to known meeting providers, or it becomes a channel for phishing. And a meeting invitation must not become the loophole that reaches a client registered on Do Not Disturb at ten at night.

Dates and times shown as DD-Mmm-YYYY and 24-hour HH:mm throughout, including downloads and reports.

Evidence for chat and online meetings, and WhatsApp

For chat and online meetings the rep uploads a **screenshot** as evidence, visible to their senior to verify, with guidance on screen to capture the full window rather than a crop.

Two honest notes. A screenshot is an attached file, so it is **weaker evidence than the visit photograph** - they should be presented as different tiers. And “full screen, not cropped” can be asked for but not enforced; the senior’s review is the real control, which is what was proposed.

WhatsApp from within the application - what is actually possible today:

Capability	Position (checked, 2026)
Sending and receiving messages	Available
Voice calls	Released globally during 2026, but reaching only large providers so far - depends on which messaging partner SIHL appoints
Video calls	Not available. Announced as planned by WhatsApp, not yet released

Video calling through WhatsApp cannot be promised. It does not exist as a feature today. Voice calling is achievable, but only through certain messaging partners - so it should form part of choosing that partner rather than being assumed.

There is also a business choice here, not a technical one:

Approach	Gain	Cost
Open the rep's own WhatsApp with the number and message ready	Free, works today, uses the number the client already recognises	Nothing is recorded in the system - the conversation stays on the rep's phone
Official WhatsApp business channel	Every message recorded and auditable, with consent and Do Not Disturb checks applied	Sends from a company number , not the rep's own; charged per conversation

For a regulated firm the company number is the stronger answer precisely because it is recorded - but it changes how the relationship feels to the client, so this is for the business to decide.

Interaction form

- Status change moves inside Log interaction, above the button - “what happened” and “where it now stands” are one thought for a rep.
- Button relabelled. **“Save interaction”** is suggested over “Save log interaction”, which is slightly redundant.
- Activity timeline shows the latest three, with more opening the full history in a table with precise timestamps.
- **Planning a visit** carries the mode - call, visit or online meeting - with the meeting link created and shared from the same screen, the lead's details shown on selection, and the list ordered by scheduled date.

Two details to confirm on the planning screen: there is currently no separate “lead type” recorded - please confirm what this should mean. And “investment” alongside “estimated value” reads as two different figures; if it means the amount actually committed, that is the value captured at closure in change 8 rather than something new.

One change to the request. Rather than disabling the button until everything is filled, keep it enabled and show clear errors against the missing fields on click. A disabled button tells the user nothing about *why*, and on a long form it often sits nowhere near the field that is missing.

11 Session timeout, and a collapsible menu

Sign the user out after **15 minutes of inactivity**, prompting two minutes beforehand with the option to stay signed in. The left menu collapses to a hamburger, remembering each user's preference.

Worth knowing: the sign-in already expires at 15 minutes and renews quietly in the background, so a user stays signed in for weeks. What is being asked for is an *inactivity* timeout - a different mechanism, and one that also has to be enforced on the server, not only on the screen.

One caution. Fifteen minutes is short for a system people use between client calls. Anything a rep has typed but not yet saved **must survive the timeout** - losing a half-written visit note is the quickest way to make the team resent the system, and that note is precisely what we want them writing.

10 Voice and regional language input

The Note field becomes **Remarks**, and accepts three kinds of input, all producing English:

- Typing in **regional script** - Gujarati, Hindi and so on.
- Typing in **romanised form** - "client ne kaha next month ma invest karse". This matters most: a rep on a phone is far likelier to type this way than to switch keyboards, and it needs an extra conversion step to translate accurately.
- **Speaking** - 30 seconds with a timer, roughly 500 characters, appending rather than replacing so several passes build a longer note.

Bhashini - the Government of India's language platform - is recommended and approved: built for Indian languages, and processing stays in India. The audio is converted to text and discarded, never stored.

Translate faithfully - do not let it improve the English. The moment software is asked to make a note sound more professional, it starts making choices about meaning. The difference between "client *will* invest Rs. 5 lakh" and "client *may* invest Rs. 5 lakh" is not a style question in a regulated firm. The original wording is kept alongside the English, and the rep can always edit before saving.

On the whole application in ten languages - recommend staging it. Translation is not a one-time project: every future change would carry a ten-language cost permanently. All four branches are currently in Gujarat, so the real need today is Gujarati and Hindi. Suggested order: translate what reaches the client first (message templates, product information - these are data and need no release), then the screens in English and Gujarati, then further languages on demand.

SEBI and risk-disclosure wording needs professionally approved translations, not machine output. Mistranslated disclosure text is a compliance exposure.

Decisions needed from management

#	Decision	Owner
2	Confirm PAN moves behind an optional control rather than carrying a "not mandatory" label	Management
4	Retention period for visit photographs and meeting screenshots	Compliance
4	Front camera (the person) or rear camera (the premises) for the visit photograph	CBDO
7	Product keeps the name "SIHL ONE" in text; logo is the company mark	Management
8	Only back-office-matched values feed incentive and performance	Management

#	Decision	Owner
8c	WhatsApp through the rep's own number (not recorded) or a company number (recorded and auditable)	Management
9	Button label - "Save interaction". Meaning of "lead type" and "investment" on the planning screen	Management / CBDO
10	Staged language rollout, and approved translations for SEBI wording	Management / Compliance

Dependencies outside the development team

These take calendar time and no engineering effort. Starting them now costs nothing; starting them late blocks delivery.

Dependency	Blocks
Message provider - not yet connected. Messages are currently recorded but not delivered. The choice of provider also decides whether WhatsApp voice calling is available at all.	Meeting invitations, WhatsApp, all client messaging
Mapping service for the address printed on the visit photograph	In-app visit capture
WhatsApp template approval by Meta - free-form messages are not permitted	Invitations over WhatsApp
Bhashini commercial terms - the free tier covers pilot use only; production pricing is not published	Voice input beyond the pilot
Back-office reconciliation feed	Incentive calculation from verified values
Company telephony - call-connect data	The strongest lead verification method
Brand assets - vector logo, square mark, dark version	Change 7

Suggested order of work

- 1. The defect, and real user accounts** - Temporary passwords currently never expire. And while the team shares demo logins, the audit trail cannot attribute an action to a person - which is the one thing it exists to do.
- 2. Quick wins** - PAN control, date formats, interaction form, brand mark once assets arrive. Small, visible, low risk.
- 3. Foundations** - Shared filters, product display, configurable statuses, sub-products. These unblock the rest.
- 4. The data-quality core** - Lead verification and conversion reconciliation - highest value, and dependent on telephony and the back-office feed, so begin those conversations in step 1.
- 5. Field and language** - Visit evidence, accompaniment, meeting modes, voice and regional input.

Recorded as considered and not proceeding

So that when these resurface, the reasoning is already written down.

Proposal	Outcome
OTP verification at lead entry and import	Not proceeding. Cannot distinguish a fake number from a fake number the rep controls. An OTP to someone who requested nothing is also an unsolicited commercial message. Replaced by change 1.

Proposal	Outcome
A “PAN is not mandatory” label	Not proceeding. Restates the asterisk while still not saying “don’t ask”. Replaced by an optional control with guidance.
The whole application in ten languages at once	Re-scoped. A permanent cost on every future change, for a footprint currently entirely in Gujarat.
Video calling through WhatsApp	Not possible. Not a scoping choice - WhatsApp does not offer video calling to businesses today; it is announced but unreleased. Voice calling is achievable through certain messaging partners.
Video provider integration for online meetings	Deferred. Licences and per-user setup for every rep, to save pasting a link.
Disabling the save button until all fields are filled	Not proceeding. Gives the user no indication of what is missing. Replaced by errors shown against the fields.
